Predicting Chronic Illness Using Questions

Doctors and AI systems often use structured questionnaires to:
✔ Identify risk factors
✔ Detect symptoms
✔ Check family history
✔ Assess lifestyle patterns

These answers are then analyzed using scores or probability models to estimate risk levels.

Question Categories

Category	Purpose	Example Question
Personal Info	Age, BMI — affects risk	What is your age / height / weight?
Lifestyle	Detect unhealthy habits	Do you smoke / drink? Hours of sleep?
Family History	Genetic risk	Does your family have diabetes / heart disease?
Symptoms	Identify early signs	Do you often feel tired?
Medical History	Existing conditions	Any hospitalization before?
Mental Health	Affects body health	Do you feel stressed often?
Physical Activity	Body strength	How often do you exercise?

Scoring / Prediction Method

Assign scores to answers:
- Healthy lifestyle: 0
- Moderate risk: 1–2
- High risk: 3–5

Risk Levels:
0–3 → Low risk
4–7 → Moderate risk
8+ → High risk (suggest checkup)

Example Questions for Diseases

Disease	Example Questions
Diabetes	Excessive thirst? Family history? Tired after eating?
Heart Disease	Chest pain? Smoke? Shortness of breath?
Thyroid	Sudden weight changes? Hair loss? Mood swings?
Asthma	Frequent cough? Polluted area? Breathing issues?
Arthritis	Joint pain when walking? Morning stiffness?

Important:
This method does not diagnose disease. It predicts risk levels and recommends further evaluation.
It should be used as a screening tool, not a medical conclusion.
