

Predicting Alzheimer's Disease Using Questions

Alzheimer's disease prediction relies on memory assessment, cognitive function, lifestyle, and family history. These questions do NOT diagnose but help estimate risk levels and recommend further neurological evaluation.

Key Categories for Alzheimer's Screening

Category	Purpose	Example Questions
Cognitive Function	Memory & thinking	Do you forget recent events often?
Behavioral Changes	Mood & personality	Have your moods changed lately?
Daily Activity Ability	Routine functioning	Do you struggle with daily tasks?
Lifestyle	Brain health habits	Do you read, exercise or socialize?
Family History	Genetic risk	Does your family have Alzheimer's?
Physical Health	Related conditions	Do you have hypertension or diabetes?

Common Warning Signs

- Memory loss affecting daily life
- Confusion about time/place
- Difficulty finding words
- Trouble solving problems
- Mood swings or personality change
- Withdrawal from social activities

Risk Scoring Pattern

Assign scores to responses:

- ✓ No symptoms: 0
- ✓ Mild difficulty: 1–2
- ✓ Severe memory/cognitive issues: 3–5

Risk Levels:

0–3 → Low risk

4–7 → Moderate risk

8+ → High risk — suggest neurological evaluation (MMSE / Brain Scan)

Important:

This method does not diagnose Alzheimer's but helps identify possible cognitive decline. Early detection improves treatment and quality of life. Medical tests are necessary for confirmation.
