

Predicting Diabetes Using Questions

Diabetes prediction can be done using structured questions to assess risk factors, symptoms, and lifestyle. These do NOT diagnose but help estimate the likelihood of diabetes and recommend further medical evaluation.

Key Categories for Diabetes Screening

Category	Purpose	Example Questions
Demographics	Age/Gender/BMI	What is your age and weight?
Lifestyle	Detect habits	Do you exercise regularly?
Diet	Sugar/Fat intake	Do you consume sugary foods often?
Symptoms	Early warning signs	Do you feel tired after eating?
Family History	Genetic risk	Does your family have diabetes?
Sleep & Stress	Mental health impact	Do you sleep well? Do you feel stressed?

Common Symptoms of Diabetes

- Frequent urination
- Excessive thirst/hunger
- Sudden weight changes
- Blurred vision
- Tingling in hands/feet
- Fatigue after meals

Scoring Pattern (Risk Estimation)

Assign scores to responses:

- ✓ Healthy lifestyle: 0
- ✓ Moderate risk: 1–2
- ✓ High risk: 3–5

Risk Levels:

0–3 → Low risk

4–7 → Moderate risk

8+ → High risk — suggest medical test (HbA1c / Fasting Sugar)

Note:

This system does not diagnose diabetes. It only predicts risk and suggests further tests. Medical evaluation is necessary for confirmation.
